

Super global variables in PHP

Variable	Description
<code>\$GLOBALS</code>	Contains a reference to every variable within the global scope of the script. The keys are the names of the global variables.
<code>\$_SERVER</code>	An array containing information such as headers, path and script location. The entries in this array are created by the web server.
<code>\$_GET</code>	An associative array of variables passed to the current script via HTTP GET method.
<code>\$_POST</code>	An associative array of variables passed to the current script via HTTP POST method.
<code>\$_FILES</code>	An associative array of variables uploaded to the current script via HTTP GET method.
<code>\$_REQUEST</code>	An associative array consisting of the contents of <code>\$_GET</code> , <code>\$_POST</code> and <code>\$_COOKIE</code> .
<code>\$_COOKIE</code>	An associative array of variables passed to the current script via HTTP cookies.
<code>\$_SESSION</code>	An associative array containing session variables available to the current script.
<code>\$_PHP_SELF</code>	A string containing PHP script file name in which it is called.
<code>\$php_errormsg</code>	Variable containing the text of the last error message generated by PHP.
